### Abstract of EP1177793

The use of gas(es) (I) in combination with active agent(s) (II) in the production of at least part of an inhalable medicament (A) is new. (II) is selected from paracetamol, acetylsalicylic acid, arylcarboxylic acids, corticosteroids, mineralo steroids, non-steroidal antiinflammatory agents (or derivatives), codeine (or derivatives), morphine and morphinomimetic agents. Independent claims are included for: (a) an inhalable medicament (A) containing the combination of (I) and (II); and (b) an aerosol delivery device consisting of a reservoir, a diaphragm located in hermetically sealed fashion in an opening in the reservoir and a valve passing in hermetically sealed and slid able fashion through an opening in the diaphragm and the opening in the reservoir, where the reservoir contains an inhalable medicament (A') comprising a combination of (I) and analgesic agent(s) (II').
